WEB APPLICATIONS – WORKSHOP 3

B&B – Implementation Report

Bit & Bolt

Students: Steven Rodríguez and Kevin Erazo

Date: September 4, 2026

1. Project Overview

B&B Solutions is a responsive one-page website for a technical service focused on computers and smartphones. The website presents software support, hardware diagnosis and repair, preventive computer maintenance for $15, and remote software assistance through AnyDesk.

The visual design was created to resemble a modern technology-service website, with clear calls to action, visible contact information, service descriptions, and a simple customer journey.

2. HTML Implementation

The website structure was developed using semantic HTML elements such as `header`, `nav`, `main`, `section`, `article`, `figure`, `form`, and `footer`.

The page includes:

- A navigation bar with links to the main sections.
- A Hero section with a heading, short description, and action buttons.
- A services section for computer and smartphone technical support.
- A remote-support section using AnyDesk.
- An image gallery with four images.
- A contact form with fields for name, email, service type, message, and service rating.
- Contact information, including the phone number 0960438690.

3. CSS Implementation and Responsiveness

The website layout uses both CSS Grid and Flexbox.

CSS Grid is used for the service cards, gallery, process section, and contact area, while Flexbox is used for the navigation bar, buttons, branding, and smaller interface components.

Hover effects were implemented for navigation links, buttons, service cards, and gallery images.

Responsive media queries were also added so the website adapts correctly to desktop, tablet, and mobile screen sizes. At smaller resolutions, the layout changes from multiple columns to a single-column structure to improve readability and usability.

4. jQuery Interactivity

The project uses jQuery to implement the interactive requirements of the workshop.

- **Random Hero background:** When the user clicks the Hero-section button, jQuery generates a random HSL color and applies it to the background.
- **Image gallery modal:** Clicking a gallery image enlarges it inside a popup modal. The modal can be closed using the close button, by clicking outside the image, or by pressing the Escape key.
- **Form validation:** jQuery verifies that the user enters valid information before the form is submitted. The validation checks the name, email, selected service, message, consent field, and rating when applicable.
- **Successful submission:** When all required information is valid, the website displays the message:

  `Form submitted successfully!`

  The form is included for demonstration purposes only. The submitted information is not stored, sent to a server, or saved in a database.
- **Additional interactions:** The project also includes a responsive navigation menu, star-rating selection, dynamic form fields, and a character counter for the message area.

5. Remote Support and Safety

The website presents AnyDesk as a remote-support option for software-related problems that do not require the physical presence of a technician.

The customer must initiate the support request and authorize the remote connection. This approach is intended to provide assistance with operating-system problems, software configuration, application errors, malware-related issues, optimization, and similar software tasks.

Hardware problems, physical maintenance, component installation, and device repair require direct technical service instead of remote access.

6. Services Presented

The website includes the following main services:

- Computer preventive maintenance for $15.

- Computer software diagnosis and repair.
- Hardware diagnosis and component replacement.
- SSD and RAM upgrades.
- Smartphone software support.
- Smartphone hardware diagnosis.
- System optimization and cleanup.
- Remote technical support through AnyDesk.

7. Challenges and Solutions

One of the main challenges was creating a visually professional website while keeping the project simple enough to satisfy the workshop requirements.

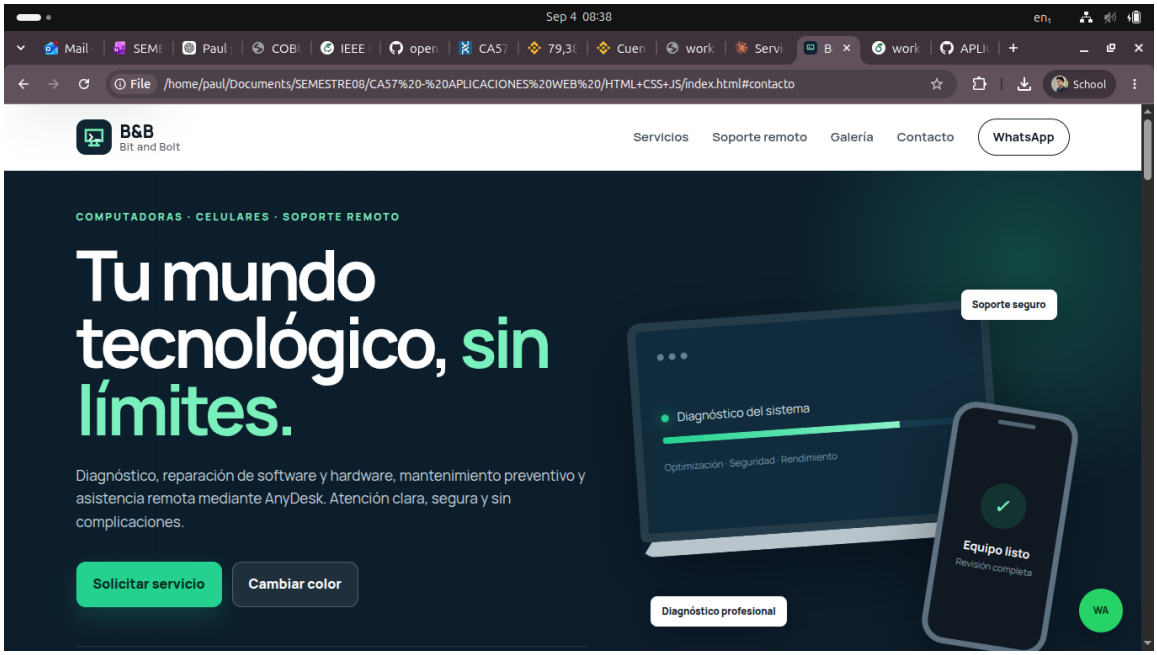

This was solved by creating reusable CSS classes, maintaining a consistent visual style, using a limited color palette, and organizing the content into clearly separated sections.

Another challenge was making the gallery functional without depending heavily on external image-hosting services. The gallery therefore uses project assets that can be opened directly from the website.

The form also required additional validation logic because it allows the visitor to contact the technical service, request support, or rate the service. jQuery was used to dynamically manage these interactions.

8. Screenshot

The following section should contain a screenshot of the working webpage.

9. Repository

The complete project source code is available in the following repository:
